What is claimed is:

1. An optical disk drive comprising:

an offset controller for changing a focus offset of laser in a direction of an optical axis to a focal point on an optical disk;

a pre-test data recorder for recording pre-test data in a trial write area provided on the optical disk with the laser having a power kept in constant while the focus offset is changed by said offset controller;

an offset detector for detecting a focus offset that minimizes an asymmetry value of a read signal of the pre-test data;

a power controller for recording an Optimum Power Control (OPC) test data in the trial write area while changing the power of the laser; and

an OPC operator for determining an optimum power of the laser in accordance with an asymmetry value of a read signal of the OPC test data.

2. The optical disk drive of claim 1, wherein the asymmetry value is calculated by equations:

$${-(T'-U')/(T'+U')}\times 100 (\%);$$

T'=T-Tref: and

U'=U-Uref,

where T is a top level of the read signal, and Tref is a reference level of the top level, and

where U is a nottom level of the read signal, and Uref is a reference level of the bottom level.

- 3. The optical disk drive of claim 1, wherein said OPC operator adjusts the focal point of the laser according to the focus offset detected by said offset detector.
 - 4. The optical disk drive of claim 1,

wherein said pre-test data recorder records the pretest data in a single-trial write area in the trial write area, and

wherein said power controller records the OPC test data in the single-trial write area.

5. The optical disk drive of claim 1, further comprising:

a focus error signal detector for detecting the focus offset as a focus error signal,

wherein the focus offset changed by said offset controller ranges in a focus offset corresponding to -50% to +50% of an amplitude of the focus error signal.

6. An optical disk drive, comprising:

an offset controller for changing a focus offset of laser in a direction of an optical axis to a focal point on an optical disk;

a pre-test data recorder for recording pre-test data in a trial write area provided on the optical disk with the laser having a power kept in constant while the focus offset is changed by said offset controller;

an offset detector for detecting a focus offset that maximizes an amplitude of a read signal of the pre-test data;

a power controller for recording an Optimum Power Control (OPC) test data in the trial write area while changing the power of the laser; and

an OPC operator for determining an optimum power of the laser in accordance with the amplitude of the read signal of the OPC test data.

- 7. The optical disk drive of claim 6, wherein said OPC operator adjusts the focal point of the laser according to the focus offset detected by said offset detector.
 - 8. The optical disk drive of claim 6,

wherein said pre-test data recorder records the pre-test data in a

single-trial write in the trial write area, and

wherein said power controller records the OPC test data in the single-trial write area.

- 9. The optical disk drive of claim 6, further comprising:
- a focus error signal detector for detecting the focus offset as a focus error signal,

wherein the focus offset changed by said offset controller ranges in a focus offset corresponding to -50% to +50% of an amplitude of the focus error signal.
